Commenting And REPL In Python

1. Single-line comment

Use # at the start of the line:

This is a single-line comment

print("Hello") # This prints Hello

2. Multi-line comment

Python doesn't have a special multi-line comment, but we use ''' or """:

'''

This is a multi-line comment

It can take more than one line

'''

REPL

It is a **Python environment** where you can **write code and see the result immediately**.

- *R - Read → Python reads what you type*
- *E - Evaluate → Python runs (calculates) it*
- *P - Print → Python shows the result*
- *L- Loop → Then it waits for the next command*

So, REPL = A

live playground

for Python.
